The Veterans Benefits Administration (VBA) provides disability compensation to veterans with a service-connected injury, and to receive disability compensation from the Department of Veterans Affairs (VA), a veteran must submit a claim or have a claim submitted on his or her behalf. Evaluation of the Disability Determination Process for Traumatic Brain Injury in Veterans reviews the process by which the VA assesses impairments resulting from traumatic brain injury for purposes of awarding disability compensation. This report also provides recommendations for legislative or administrative action for improving the adjudication of veterans' claims seeking entitlement to compensation for all impairments arising from a traumatic brain injury.

Concussions are increasing in incidence each year, and each state has a law on management of concussions in children. These factors strengthen the need for primary care providers to be well-versed in the evaluation and management of them. This text provides primary care physicians and clinicians with an evidence-based yet practical approach to diagnosing and treating concussions in children and adults. The book begins with a general overview of concussions. It then goes on to identify risks, signs and symptoms of concussions. Next, physicians and providers learn when and how to perform appropriate physical exams for suspected concussions. The following chapters focus on finding the correct type of testing to perform in suspected concussions. The testing options addressed include diagnostic, neurocognitive and imaging. Return-to-learn and return-to-play recommendations are then discussed to ensure that providers are

able to properly educate patients on them. The book concludes by explaining post-concussion syndrome and identifying methods to prevent concussions and complications in the future. Each chapter presents a specific case along with 3-5 followup questions as well as a summary of key concepts. Written from the unique perspective of a primary care physician who also specializes in sports medicine and concussions, Concussion Management for Primary Care is a first-of-its-kind book that serves as a valuable resource for primary care physicians, sports medicine physicians and any other clinician treating patients suffering from a possible concussion.

Minor Head Trauma Springer Science & Business Media

A cutting-edge synthesis of science and practice, this book covers everything from sports-related concussions to less common types of mild traumatic brain injury (mTBI) and related complications. Preeminent authorities review what is known about mTBI in childhood and adolescence—including its biomechanics, pathophysiology, and neurological and neurobehavioral outcomes—and showcase evidence-based clinical evaluation tools and management strategies. Challenging areas such as evaluating complicated mTBI and treating persistent problems after injury are discussed in detail. Also addressed are forensic issues, injury in very early childhood, and other special-interest topics.

Mild Traumatic Brain Injury in Children and Adolescents Springer Science & Business Media

The case studies in this book use authentic injury assessment examples to help readers link theory and clinical practice with the goal of becoming competent clinicians. The situations are realistic and present more than 130 of the injuries that athletic trainers may encounter in the real world. The questions that accompany the cases ask readers to identify clinical and differential diagnoses, critique the evaluating clinician's actions, recommend treatment, comment on ethical choices, and make many of the decisions they will face in the field. The cases encourage readers

to think and problem solve; evidence-based answers (for select cases in the text and for all cases in the instructor's manual) ensure that the recommended clinical decisions are based on the best available research, clinical expertise, and patient preferences rather than on anecdotal practice.

Critical Care Medicine Review: 1000 Questions and Answers WestBow Press

Each day throughout the world hundreds of people suffer head injuries. Whether they are caused by traffic accidents, or violence, or occur during sports and leisure activities, these injuries can dramatically and tragically alter the victim's ability to cope with life. In many countries, after-care of the victim, once the injury is no longer life-threatening, is often inadequate, and all too often families are left to manage as best as they can. The book is written for families who find themselves in this situation. The authors have had many years of experience working with head-injured people in both research and rehabilitation roles. The effects of injury are explained in non-technical terms and, where possible, practical ways of overcoming these effects are described. Because they also have many years of experience working with organisations that have been formed to help the families of the head-injured, the authors know the main areas of concern that these families have. Beginning with the injury itself, the stages that the patient will go through are described, and the procedures and techniques that will be used to chart progress are explained. As well as these direct effects of the injury on the victim, the book also examines the ways that head trauma can affect families and friends. For the person who will eventually recover sufficiently to do so, there are suggestions on managing the return to work or school most effectively. For those who will never reach this level, there is a section which describes the long-term adjustments that these people and their care-givers need to make. The final section outlines the requirements of a head injury rehabilitation system, and gives some suggestions about the steps that individuals can take to ensure that this sort of service is

provided in their area. This new edition has been fully updated, to reflect the recent advances in medical science that mean that many more people with head injury survive, and also new trends in health care and rehabilitation.
